

QUALITY... PLAIN & SIMPLE®

Ford AOD-4R70W-AODE Cable Operated Shifter Installation Instructions

General Installation Notes:

Please read these instructions completely before beginning the installation. If you have any questions, please call.

Before beginning the installation, disconnect the negative battery cable and use wheel chocks to block the vehicle's wheels.

Make sure the engine, transmission, body and frame are properly grounded.

All Lokar Installation Instructions can be found by visiting www.lokar.com/instructions.html.

When installing a Lokar shifter onto an AOD transmission, Lokar's AOD Kickdown Kit will also be required (sold separately).

Refer to Figs. 1 and 2 for the component names.

Tools and Materials Required:

- Standard Allen wrenches: 5/64", 1/8", 5/32", 3/16"
- Wrench or Socket Sizes: 3/8", 7/16", 1/2", 9/16", 7/8", 15/16", 13mm
- Tape Measure
- Metal cutting tool, such as a hacksaw or a die grinder with a cut-off wheel
- Drill and 5/16" drill bit
- Ohmmeter
- Wire cutters/strippers
- Wire crimping or soldering tools
- Blue thread locking compound

Lokar Shifters are designed to fit specific transmissions. Before installing the shifter, verify that you have the proper model for your transmission. If your shifter does not seem to connect to the transmission properly, do not make modifications during installation as this may void your warranty. Call for assistance.

Verify that the shifter length you have purchased is what you actually want. When installed, the bottom of the shifter lever will be approximately 3-1/2" - 4" above the bottom of the shifter main frame. From that point up to the top of the knob is how the shifter length is determined.

This shifter requires the installation of a Lokar Selector Shaft and Trans Arm kit (included). The Selector Shaft and Trans Arm kit can be installed with the transmission in the vehicle. However, if the transmission is already removed from the vehicle, it is easier to install the Selector Shaft and Trans Arm kit while the transmission is out.

The shifter must be installed into the vehicle before attempting to make any adjustments. The shifter is designed to lock in Park and in Neutral. You must depress the release button in the top of the shifter knob in order to shift out of Park or Neutral.

To shift from Park directly to Overdrive, depress the release button and hold it down while moving the shifter lever, and the shifter will automatically stop in the Overdrive position. Once you release the button, the shifter will allow you to move the lever into Drive. You must depress the button again to shift down into low gear.

Step 1: If your vehicle already has a shifter of any type installed, disconnect all shifter linkage and remove the shifter and its related hardware (neutral safety switch, back-up light switch, etc.).

Fig. 1

Step 2: Take four 5/16" lock washers and the four 5/16"-24 x 3/8" button head bolts from the transmission shifter packet. **Make sure you are using 3/8" long bolts. They will be the shortest bolts that are in the packet.**

Place a lock washer on each of the bolts.

Position the shifter assembly into the floor mount mounting bracket as shown in Fig. 3. The floor mount mounting bracket can be installed in either direction (it does not have a front or a back). Install the 5/16"-24 x 3/8" button head bolts with lock washers through the curved, slotted holes and into the shifter assembly using a 3/16" Allen wrench. **Fig. 3**

Fig. 2

Fig. 3

Step 3: Determine exactly where you want the Shifter to be located. The Shifter may be mounted either on top of the floor or underneath the floor.

NOTE: For vehicles that had a floor shifter previously, determine if the existing hole(s) in the floor will be adequate for mounting and operation of the Lokar Shifter. If not, the floor will need to be modified.

If you are mounting the Shifter on top of the floor, you will need a slot in the floor for the quad shift lever to pass through. If you are mounting the Shifter underneath the floor, the opening will need to be large enough for the floor mount mounting bracket also.

NOTE: Round Lokar Shifter Boots and Boot Rings CANNOT be mounted directly on the floor with a Lokar Cable Operated Floor Mount Shifter.

The Shifter comes with a quad shift lever that has a 2-1/2" offset, which works the best in most installations. In the event that the 2-1/2" offset will not work, Lokar has quad shift levers available in both straight and 1-1/4" offset configurations. The bottom end of the quad shift lever should be generally aligned with the trans arm on the transmission. It is not necessary that the quad shift lever be perfectly aligned with the trans arm. The rod ends allow for a certain amount of misalignment.

Step 4: There are two pairs of floor mount tabs in the Shifter Kit. Which pair goes where will depend on if you are mounting the Shifter above or below the floor. See **Fig. 4** to determine how the floor mount tabs need to be positioned for your particular application.

The floor mount tabs on the rear of the Shifter must be installed with the ears pointing towards the rear of the vehicle. If you are using a rectangular Lokar Shifter Boot and Ring mounted directly to the floor, the floor mount tabs on the front of the Shifter must also be installed pointing towards the rear of the vehicle. If you are not using a rectangular Lokar Shifter Boot and Ring, you may install the front floor mount tabs facing either direction.

Attach the floor mount tabs to the floor mount mounting bracket as shown in **Fig. 4** with the 5/16"-24 x 1/2" button head bolts and lock washers. Leave the bolts loose enough so that adjustments can be made later during the installation.

Step 5: Make sure the two 5/16"-24 x 3/8" button head bolts and lock washers that are in the curved, slotted holes in the driver side of the floor mount mounting bracket are tight using a 3/16" Allen wrench. Place the Shifter in the desired location on the vehicle's floor. Make sure the shifter lever will not interfere with the dash when in Park, or with the seat when in low gear. The shifter assembly may be tilted forward or backward if needed by loosening the two 5/16"-24 x 3/8" button head bolts and lock washers that are in the curved, slotted holes in the driver side of the floor mount mounting bracket. Retighten the button head bolts and lock washers in the curved, slotted holes once you have the shifter assembly at the angle you want. **Fig. 5**

If you ever disassemble the shifter assembly, be sure that the 5/16"-24 x 3/8" button head bolts and lock washers are put back into the curved, slotted holes in the floor mount mounting bracket. **Installing longer bolts will prevent the Shifter from operating.**

NOTE: If you find after installation that the shape or length of the shifter lever is not suitable for your application, Lokar has a number of different styles and lengths of Shifter Lever Replacement Kits available for purchase separately through our dealer network.

Fig. 4

Fig. 5

Fig. 6

Fig. 7

Fig. 8

Step 6: Determine the size and location of any opening(s) that need to be cut in the floor in order to mount the shifter assembly and allow full travel of the quad shift lever. Move the shifter lever through its full range of motion, in order to help determine where the cuts need to be made.

Cut those openings now.

Step 7: Place the shifter assembly in position on the vehicle. Push the floor mount tabs flush against the floor, and mark the center of the bolt holes in the floor mount tabs onto the floor. Center punch the marks, and drill four 5/16" diameter holes

Step 8: Attach the floor mount tabs to the floor using four 5/16" x 1/2" button head bolts and nylock jam nuts. Once the shifter assembly is mounted to the floor, tighten the floor mount tab to floor mounting bracket bolts using a 3/16" Allen wrench.

Step 9: Make sure the shifter lever is in the Park position. Temporarily place the quad shift lever in position on the quad lever bushing as shown in **Fig. 6**. Check for interference with the driver side rear floor mount tab or the vehicle floor. With the shifter lever in Park, you want the quad shift lever to be as close to the 4:30 – 5:00 position as the floor mount tab will allow, without the quad shift lever touching the floor mount tab or floor.

If the quad shift lever is not pointed towards the 4:30 - 5:00 position, loosen the 1/4"-20 x 5/16" set screw in the top of the quad lever bushing using a 1/8" Allen wrench. Slide the quad lever bushing off of the shifter. Reinstall the bushing pointed towards approximately the 4:30 - 5:00 position as shown. Retighten the set screw.

With the quad shift lever in position on the quad lever bushing, install the 1/4"-28 x 5/8" button head bolt and lock washer into the bushing, and tighten with a 5/32" Allen wrench. **Fig. 6**

Step 10: If the provided Lokar Selector Shaft and Trans Arm were not installed before beginning the shifter installation, install them now, following the instructions that came with that kit. If you are working on an AOD transmission, the Lokar Kickdown Kit should be installed at the same time.

Place the trans arm in the Park position with the tip of the lever pointing down and forward, at approximately the 7:30 position. **Fig. 7**

Step 11: Remove the two pan bolts directly behind the selector shaft. Install the lower cable mounting bracket on the driver side of the transmission pan, using the provided M8 x 40mm bolts, lock washers, flat washers, and 3/4" spacers. The spacers go in between the bracket and the transmission pan. Do not tighten the bolts yet. **Fig. 8**

Step 12: Make sure that the shifter and the transmission are both in the Park position. Remove the first 5/8"-18 jam nut (15/16" wrench size) and one of the internal tooth lock washers from the cable. Install the cable into the lower cable mounting bracket, and reinstall the lock washer and jam nut onto the cable.

Step 13: Make sure that the 1/4"-28 jam nuts are installed on each end of the cable. Then, install the rod ends onto the cable, threading them on approximately halfway. Do not tighten the jam nuts against the rod ends yet.

Step 14: The inner cable needs to be fully extended all the way out at the transmission end when it is attached to the trans arm. Pull the inner cable out as far as it will go at the transmission end. Adjust the position of the lower cable mounting bracket, the position of the cable itself in the bracket, and/or the rod end so that the hole in the rod end lines up with the hole in the trans arm with the inner cable fully extended and the transmission in Park.

Step 15: Attach the rod end at the transmission to the trans arm using a 1/4"-28 x 1" button head bolt, flat washer, and nylock nut. The rod end will be positioned on the inside of the trans arm, towards the transmission. The button head bolt can be installed from either direction, but make sure the rod end is sandwiched between the flat washer and the trans arm. **Fig. 9 & 10**

Step 16: Route the cable up to the shifter and attach the other rod end to the quad shift lever using a 1/4"-28 x 1" button head bolt, flat washer, and nylock nut. **Fig. 11** The button head bolt can be installed from either direction, but make sure the rod end is sandwiched between the quad shift lever and the flat washer. When routing the cable, make sure that it is not touching the exhaust or any moving parts. The cable should be routed as smoothly as possible without any sharp bends.

Step 17: Position the upper cable mounting bracket up against the bottom of the floor and next to the cable, aligned with the retaining groove on the cable. Align the upper cable mounting bracket with the quad shift lever, where the cable can push and pull in a smooth motion. **The location of the upper cable mounting bracket is an important factor in how smoothly the shifter operates, so make sure it is aligned correctly.**

Determine how the cable clamp should be oriented on the upper cable mounting bracket and which bolt hole should be used for the best alignment with the quad shift lever. The cable clamp can be installed with the bolt above or below the cable. Insert the 5/16"-24 x 1" button head bolt into the cable clamp, and position the cable clamp on the cable, making sure that the bolt is seated in the retaining groove. **Fig. 12**

Install the cable clamp and 5/16"-24 x 1" button head bolt onto the upper cable mounting bracket and secure with a nylock nut. **Fig. 13**

Step 18: Make sure that the location chosen for the cable clamp on the upper cable mounting bracket will allow the cable to go straight to the hole in the quad shift lever without binding at any point in the shifter travel. Before drilling the bolt holes in the floor, be sure everything is mocked up correctly and if possible, clamp the upper cable mounting bracket in place and check operation of the shifter. Mark the center of the holes, center punch the marks, and drill both holes using a 5/16" drill bit.

Step 19: Mount the upper cable mounting bracket to the floor using the 5/16"-24 x 1/2" button head bolts and nylock jam nuts. **Fig. 14**

Fig. 9

Fig. 11

Fig. 10

Fig. 13

Fig. 12

Step 20: Check the adjustment of the shifter cable by placing the shifter lever all the way forward into the Park position. Make sure that the release button still moves up and down freely. The release button should be flush with the knob in Park and Neutral. In the Reverse position, you cannot pull the lever back into Neutral without depressing the release button.

While the shifter lever is in the Park position, make sure the transmission is firmly in the Park detent, with no tension on the cable. You can verify that there is no tension on the cable by removing the 1/4"-28 x 1" bolt with nylock nut that attaches the rod end to the quad shift lever or trans arm at either end of the cable. Make sure the hole in the rod end exactly aligns with the hole in the quad shift lever or trans arm. The bolt should pass freely through both holes at the same time without binding. Do not force the holes to line up.

If the holes are not aligned, use the 5/8"-18 jam nuts at the lower cable mounting bracket to get the adjustment close. Then, you can fine-tune it by adjusting the rod ends until you can slide the bolt in and out without putting tension on the cable. Make sure that the quad shift lever and trans arm do not move during the adjustment procedure. Also, make sure that the inner cable is still fully extended at the transmission end.

Use this adjustment routine until the bolts will pass freely in and out of both of the rod ends and the quad shift lever and trans arm. Reinstall the 1/4"-28 nylock nuts and the flat washers onto the bolts and tighten.

Once you have the shifter cable adjusted correctly, tighten the 1/4"-28 jam nuts on the ends of the cable, and the 5/8"-18 jam nuts at the lower cable mounting bracket.

Neutral Safety Switch Adjustment and Wiring

Step 21: For the neutral safety switch to function properly, the shifter linkage must be adjusted correctly. Do not attempt to adjust the neutral safety switch unless you have completed **Step 20**.

The Lokar Neutral Safety Switch is a simple on/off, non-directional switch. The switch passes current (turns on) when the ball is pushed in. It does not pass current (turns off) when the ball is out at its at-rest position.

Double check to make sure that the bolts in the curved, slotted holes in the **driver** side of the floor mount mounting bracket are tight.

Step 22: Remove the neutral safety switch and washer (**Fig. 15**) from the **passenger** side of the Shifter using a 7/8" wrench or socket.

Step 23: Loosen, but do not remove, the two 5/16"-24 x 3/8" button head bolts and lock washers that connect the passenger side of the floor mount mounting bracket to the switch plate (the bolts are in curved, slotted holes). **Fig. 15**

WARNING: Before taking the shifter lever out of Park, be sure that the vehicle's tires are blocked and the parking brake is set to avoid movement of the vehicle.

Step 24: Put the shifter lever into the Reverse position. Reposition the switch plate so that the hole in the switch plate lines up with the center groove in the shifter body. **Fig. 16** Screw the provided aluminum adjuster plug into the neutral safety switch opening. Wiggle the switch plate slightly forward and back while you are screwing the aluminum adjuster plug in will help get the shifter body centered on the adjuster plug. **Fig. 17**

Step 25: Retighten the two 5/16"-24 x 3/8" button head bolts and lock washers that attach the passenger side of the floor mount mounting bracket to the switch plate.

Step 26: Remove the aluminum adjuster plug, and reinstall the neutral safety switch and washer onto the Shifter. Test for continuity by connecting an ohmmeter lead to each stud on the neutral safety switch. When adjusted correctly, you will only have continuity between the two switch studs when the shifter lever is in Park or Neutral. Continuity in any other gear requires readjustment of the neutral safety switch or the shifter linkage.

Step 27: Connect the neutral safety switch between your ignition switch and starter circuits. Check the wiring of your fuse panel:

- **If there are (2) connections for a neutral safety switch**, run a #12 (or heavier) stranded wire from these terminals in your fuse panel to the (2) terminals on the neutral safety switch. That completes the Neutral Safety Switch wiring.
- **If your fuse panel does not have neutral safety switch connections**, locate the wire going from the ignition switch to the starter. If GM color codes are used, this wire will usually be purple. After locating the wire, disconnect it from the starter. It must be cut and routed from the ignition switch to one of the neutral safety switch terminals, and from the other neutral safety switch terminal to the same stud on the starter where the original wire was removed. If the wire must be lengthened, be sure to use wire that is at least the same size or larger than the original.

Fig. 14

Fig. 15

Step 28: Reconnect the negative battery cable and check operation. Make sure that the engine will not start in Reverse or a drive gear. If it does, follow the neutral safety switch adjustment procedure again. If your car should ever start in any gear other than Park or Neutral, please readjust the neutral safety switch accordingly. Tighten all brackets and bolts correctly and securely and there should be no movement or maladjustment. If you have any questions after following this procedure, please call Lokar Technical Support.

Step 29: Once the installation is completely finished and the neutral safety switch is adjusted, remove each of the 5/16"-24 x 3/8" button head bolts and lock washers from the curved, slotted holes in the floor mount mounting bracket one at a time, apply blue thread locking compound to the threads, and reinstall.

Fig. 18 shows a completed installation.

Fig. 17

Lokar Shifter Knob Removal Instructions (For Shifters Manufactured 1995 and Later)

For shifters manufactured 1994 and earlier, please contact Lokar for assistance.

To Remove the Shifter Knob:

Step 1: Make sure the shifter lever is all the way forward in the Park position.

Step 2: Loosen the jam nut below the shifter knob. **DO NOT** loosen or remove the set screw that is in the knob. **Fig. 19**

Step 3: Turn the shifter knob counter-clockwise to remove.

To Install the Shifter Knob:

Step 1: Make sure the jam nut is still in place on the shifter lever.

Step 2: Thread the shifter knob onto the shifter lever until the release button comes up flush with the top of the shifter knob.

Step 3: Tighten the jam nut up against the bottom of the shifter knob.

Step 4: Check to make sure that depressing the release button allows the shifter lever to be moved, and that the shifter lever still locks in Park and Neutral. If the shifter will not come out of Park with the release button fully depressed, tighten the knob one turn and check it again. If the shifter does not lock in Park, loosen the knob one turn and check it again.

Fig. 18

Fig. 19
